

RADIO ON M.V. MOONTA

A modern wireless equipment is being built by Amalgamated Wireless for the Adelaide Steamship Company's motor vessel Moonta, 2,500 tons, under construction at Copenhagen, Denmark. The Moonta will carry passengers in the Spencer Gulf trade, and a feature of the installation is a Gigantaforte for relaying gramophone music through the ship by means of three loud speakers. The main equipment comprises a 1/4 k.w. telegraph-telephone transmitter with an emergency transmitter and auto alarm apparatus. This gear will be shipped from Sydney shortly and fitted at the port of construction. A wireless operator will be in charge of the installation during the voyage out, but so simple is the apparatus in actual working that the master of the vessel will take over the operation of the set when the vessel enters upon her routine trade.
